CS340

# Properties of a heap

- A nearly-complete binary tree.
- Max-heap or min-heap.
- Largest element is at the root of a max-heap.
- **The Heap Property (max heap):**  
Parent node  $\geq$  its children
- Recursive definition:  
Each node is the root of its own heap.
- Height of node = # of **edges** from the node down to a leaf.
- Height of heap = height of root =  $\Theta(\lg n)$ .

# Heap stored as array

- **Root** = max value =  $A[1]$
- **Parent** of  $A[i] = A[i/2]$
- **Left child** of  $A[i] = A[2i]$ ; **Right child** of  $A[i] = A[2i+1]$
- Computing is fast with binary representation

# Heapsort basic methods

```
int parent(int i) {
```

```
}
```

```
int left(int i) {
```

```
}
```

```
int right(int i) {
```

```
}
```

In a max-heap,  $A[\text{parent}(i)] \geq A[i]$

# Maintaining the heap property

- Check that  $A[i]$  is larger than its children
- If not exchange it with its larger child, and recursively call MAX-HEAPIFY
- lets the value at  $A[i]$  “float down” in the max-heap
- Makes node  $i$  a max-heap root

MAX-HEAPIFY( $A, i$ )

```
1   $l = \text{LEFT}(i)$ 
2   $r = \text{RIGHT}(i)$ 
3  if  $l \leq A.\text{heap-size}$  and  $A[l] > A[i]$ 
4       $\text{largest} = l$ 
5  else  $\text{largest} = i$ 
6  if  $r \leq A.\text{heap-size}$  and  $A[r] > A[\text{largest}]$ 
7       $\text{largest} = r$ 
8  if  $\text{largest} \neq i$ 
9      exchange  $A[i]$  with  $A[\text{largest}]$ 
10     MAX-HEAPIFY( $A, \text{largest}$ )
```

# Max-Heapify Example

- Node 2 violates heap property, is switched with node 4.
- Then, node 4 violates heap property

# Running time of Max-Heapify

- $O(h)$  on a node of height  $h$
- $O(\lg n)$

# Building a heap

- Starting from an unordered array, build a heap.
- Why does it operate on  $A.length/2$  downto 1?
- Running time seems to be  $O(n \lg n)$  but it's really  **$O(n)$** 
  - Observe that the time for MAX-HEAPIFY to run at a node varies with the height of the node in the tree, and the heights of most nodes are small.

```
BUILD-MAX-HEAP(A)
```

```
1  A.heap-size = A.length
```

```
2  for i =  $\lfloor A.length/2 \rfloor$  downto 1
```

```
3      MAX-HEAPIFY(A, i)
```

# Build-Max-Heap example

|          |   |   |   |   |    |   |    |    |   |    |
|----------|---|---|---|---|----|---|----|----|---|----|
|          | 1 | 2 | 3 | 4 | 5  | 6 | 7  | 8  | 9 | 10 |
| <i>A</i> | 4 | 1 | 3 | 2 | 16 | 9 | 10 | 14 | 8 | 7  |

# Build-Max-Heap example

A [4 1 3 2 16 9 10 14 8 7]

# Build-Heap loop invariant

At the start of each iteration of the for loop, each node  $i + 1, i + 2, \dots, n$  is the root of a max-heap.

- **Initialization:**  $i = n/2$ . Each node  $n/2+1, n/2+2, \dots, n$  is a leaf and is trivially a max-heap.
- **Maintenance:** To see that each iteration maintains the loop invariant, observe that
  - the children of node  $i$  are numbered higher than  $i$ . By the loop invariant, therefore,
  - they are both roots of max-heaps. This is precisely the condition required
  - for the call `MAX-HEAPIFY(A, i)` to make node  $i$  a max-heap root. Moreover,
  - the `MAX-HEAPIFY` call preserves the property that nodes  $i+1, i+2, \dots, n$
  - are all roots of max-heaps. Decrementing  $i$  in the for loop update reestablishes
  - the loop invariant for the next iteration.
- **Termination:** At termination,  $i=0$ . By the loop invariant, each node  $1; 2; \dots; n$  is the root of a max-heap. In particular, node 1 is.
